

## **Cleaning of Metal Ceilings**

### **Armstrong – paint coatings**

Armstrong-ceiling-tiles in general are electrostatically paint coated with a polyester powder. On customer request wetpaint stove enamel coatings on acrylic basis are also available. For cleaning of both coatings see the following instructions.

### **Cleaning of Armstrong metal ceilings**

The frequency of cleaning will depend upon the function and usage of each area and the efficiency of the air conditioning/heating system. This period can only be determined after handover and occupancy. Although the ceiling materials are provided with durable paint finish, abrasive or strong chemical detergent should not be used. A mild detergent diluted in warm water applied with a soft cloth, rinsed and finally wiped off with a chamois leather will maintain the ceiling in good condition. Oily or stubborn stains if not removed by washing can be wiped off with white spirit but care is necessary to avoid affecting the gloss level of the paint finishes.
